Hi Candon,
If you are using the current 304(a) criteria, or inputs that those criteria are based on, and EPA HHC guidance, I don't think it's necessary to include any particular footnotes, assuming there's nothing that contradicts related text in the WQS.

We recently received guidance from HQ on the public notice process, I'll forward the email in case it's useful to you.

Thanks.

Maja

Hello Maja,

I appreciate you sending the spreadsheet with the calculations. One question, do you think I need to develop any footnotes for these pollutants?

Thanks,

Hi Candon,

Attached please find a spreadsheet as you requested that provides calculations for arsenic, dioxin, and thallium HHC based on inputs used for our current 304(a) recommendations. I also included the

inputs that I believe you are using for FCRs, drinking water intake, etc. This spreadsheet is for informational purposes only. As we discussed, the formulas are functional so you can change the inputs as needed.

Please let me know if you have any questions and also please keep me apprised of your schedule so I can try to get reviews scheduled here in advance, to the extent possible on all sides. I look forward to seeing your WQS.

Best wishes,

Maja

Maja,

Yes I should be in the office most of the day today. Just give me a call.

Thanks,

Hi Candon,

Following up on your earlier questions, would you have time to talk about the arsenic, thallium, and dioxin HHC tomorrow late morning or in the afternoon after 2:30, or later in the week?

Thanks.

Maja

Candon – I have set up an internal conversation for some folks here in the Region together with Maja and I for next week to discuss options regarding arsenic human health criteria. My hope is that we can develop some options/suggestions for you to consider with respect to arsenic human health criteria that we think would be protective. The goal is to provide you with that information after our internal discussion. Hope that's soon enough for you. If not please let me know.

Thanks

Hello Maja,

Thank you for sending the information and no problem on the aluminum. The phone call with Rochelle went well and I think I have the cyanotoxins covered. Can you refresh my memory on why the HHC-arsenic, thallium, dioxin are not included in the tribal model? (Arsenic was an IRIS update issue correct?) And what my options are?

Thanks,

Hi Candon,

Let me put a hold on the aluminum language briefly, I believe the toxicity response to hardness is not unidirectional for aluminum as it is for copper so a different approach may be needed for protective default inputs. Let me talk to others here and get back to you soon.

Thanks, sorry.

Subject: WQS language

Hi Candon,

Thanks for a good call today, we covered a lot of ground and I hope we were able to provide most of the information you need. I've attached the Swinomish language for their copper criteria, and language for the aluminum criteria that is parallel to the copper language for your consideration. The copper language includes basic implementation language and references EPA's default criteria document, and this language translates almost directly to the aluminum criteria. pH is important to aluminum toxicity, and is hard to predict using reference conditions, so it should be measured directly if possible.

Let me know if you would like assistance with human health criteria for arsenic, dioxin, and thallium. I'll wait to hear back from you about your discussion with Rochelle on the cyanotoxin criteria. Thanks! Please let me know if you have more questions. I'll look forward to seeing your draft standards.

Maja
